

Daily Algebra Drill #3

Section	Topic	Questions	Target time
A	Rapid Recognition	10	2 min 30 sec
B	Manipulation Drills	10	8 min
C	Substitution & Structure	8	10 min
D	Challenge	5	15 min

New toolkit today: Remainder & Factor Theorem · AM–GM & algebraic inequalities · Completing the square in two variables · Rational Root Theorem · Modular/divisibility arguments · Parametric families of solutions.

Attempt each question before checking answers. Time yourself. No calculators.

Section A Rapid Recognition

(≤15 s each)

Zero expansion. Pure pattern recognition.

- The polynomial $f(x) = x^3 - 3x^2 + kx - 8$ has $(x - 2)$ as a factor. Find k .
- Without dividing, find the remainder when $p(x) = x^{100} - 1$ is divided by $(x - 1)$.
- Factorise: $6x^2 - x - 12$.
- Simplify: $\frac{x^{2n} - 1}{x^n - 1}$ ($n \in \mathbb{Z}^+$).
- Given $x > 0$, find the minimum value of $x + \frac{9}{x}$.
- Factorise over $\mathbb{Z}$: $x^4 - y^4$.
- The roots of $2x^2 - 6x + 3 = 0$ are α and β . Find $\alpha^2 + \beta^2$.
- Simplify: $\frac{(n+1)! - n!}{(n-1)!}$ ($n \geq 1$).
- Without expanding, show that $(a+b+c)^2 - (a^2 + b^2 + c^2) = 2(ab + bc + ca)$ and state the value of $ab + bc + ca$ when $a + b + c = 4$ and $a^2 + b^2 + c^2 = 8$.
- Find the value of k such that $x^2 + kx + 16$ is a perfect square.

Section B Manipulation Drills

(≤50 s each)

Fractions, rearranging, hidden factorisations. Minimal expansion.

- Find all rational roots of $2x^3 - 3x^2 - 11x + 6$, and hence factorise it completely.
- Simplify: $\frac{x^3 + 1}{x^2 - x + 1}$.

3. Given $a + b = p$ and $a^3 + b^3 = q$, express ab in terms of p and q .
4. For $x \neq 0$, simplify: $\frac{x^2(x+1) - x(x+1)^2}{x(x+1)}$.
5. Factorise: $a^3 - a^2b - ab^2 + b^3$.
6. The sum $\sum_{r=1}^n r = \frac{n(n+1)}{2}$. Use this to find, without expanding, $\sum_{r=1}^n (2r-1)$.
7. Solve for x : $\frac{2x-1}{x+3} - \frac{x+2}{x-1} = 1$.
8. Simplify: $\left(\frac{1}{a} - \frac{1}{b}\right) \div \left(\frac{1}{a^2} - \frac{1}{b^2}\right)$.
9. Show that $n^3 - n$ is divisible by 6 for all integers n .
10. Given α, β are roots of $x^2 - x - 1 = 0$, find $\alpha^3 + \beta^3$ and $\alpha^4 + \beta^4$ without solving for α or β .

Section C Substitution & Structure(≤ 90 s each)

Find structure before computing. One good substitution beats ten lines of algebra.

1. Solve: $9^x - 10 \cdot 3^x + 9 = 0$.
2. Find the minimum value of $x^2 + y^2$ subject to $x + 2y = 5$.
3. Prove that $a^2 + b^2 + c^2 \geq ab + bc + ca$ for all real a, b, c .
4. Solve: $\sqrt{x+5} + \sqrt{x-3} = 4$.
5. The expression $x^2 + 4x + y^2 - 6y + 13$ has a minimum value. Find it, and the values of x and y at which it is achieved.
6. If $x + \frac{1}{x} = 5$, find $\frac{x^4 + 1}{x^2}$.
7. Solve over the reals: $x^4 + 4x^2 - 5 = 0$.
8. Given $a, b > 0$ with $a + b = 1$, find the minimum of $\frac{1}{a} + \frac{1}{b}$.

Section D Challenge

(TMUA / SMC difficulty)

Five lines or fewer. Find the structure, not the computation.

1. Find all real solutions to $x^4 + 2x^3 - 2x - 1 = 0$. (*Hint: the left-hand side factorises into two quadratics.*)

2. Prove that for all integers n , the expression $n^2 + n + 41$ is not always prime by finding the smallest counterexample. Then explain why $n^2 + n + 41$ is prime for $n = 0, 1, 2, \dots, 39$.
3. Let $a, b, c > 0$ with $abc = 1$. Prove that $a + b + c \geq 3$.
4. For positive reals a and b , prove that

$$\frac{a}{b} + \frac{b}{a} \geq 2.$$

Hence prove the AM–GM inequality $\frac{a+b}{2} \geq \sqrt{ab}$ for $a, b > 0$.

5. Find the number of integers n with $1 \leq n \leq 1000$ such that $n^2 - 1$ is divisible by $n + 3$.

“Mathematics is not about numbers, equations or algorithms: it is about understanding.”
— William Paul Thurston
